Insects That May Show Up In Southwest Michigan Vineyards*
June 15, 2006 Edition

Lacewings

The presence of lacewings in your vineyard is a good thing. The larvae crawl around the grape leaves looking for anything to eat. They can help control many pests such as leafhoppers, mites, aphids, and mealybugs.

Snailcase Bagworm

You may see this moth larva on your grape clusters or leaves. The larva, encased in a case made of soil and silk, feeds on grape leaves, but doesn’t eat enough to be a problem.
